

cablefix

Adhesive support for electric cables

Self-adhesive support lengths with an excellent appearance for easy attachment of electric cables. **Cablefix** secures cables to hard-to-perforate surfaces such as glass, ceramics, tiles, marble, metals as well as wood, painted walls, etc ...

cablefix is made of high quality materials to ensure optimum results.

It is composed of three main parts:

The split wings made of softer material provide good flexibility and prevent stress formation in the adhesive on surfaces that are not perfectly flat. After attachment of the shape, the cable can be installed and removed at any time, for example when changing Hi-Fi equipment from one room to another.

The base is of harder material to ensure the good linearity of layouts, as it has no lateral flexure. However, it does not prevent flexure in case of a surface which is not flat.

The special adhesive foam features high adhesiveness, absorbing surface irregularities to ensure perfect attachment. Maximum temperature: 70° C

For indoor use.
